

Gestion de l'historique avec bash

Sommaire

- Problématique
- Solutions
 - Évolutions apportées
 - Explications
 - Les scripts
 - `~/.bashrc`
 - `~/.bashrc.d/general` — le fichier qui charge les autres fichiers d'initialisation des paramètres du bash (en interactif)
 - `~/.bashrc.d/aliases` — initialisation de bash : les alias personnels
 - `~/.bashrc.d/variables` — initialisation de bash : les variables shell personnelles
 - `~/.bashrc.d/functions` — initialisation de bash : les fonctions bash pour son propre usage
 - `~/.bashrc.d/history` — initialisation de bash : la gestion de l'historique
 - `~/bin/acd_func.sh` — la fonction de changement de répertoire (`cd_func`)
 - `~/bin/a_loghistory_func.sh` — les fonctions `_loghistory`, `hh` et `hd` + alias `h=history`
- Exemples d'utilisation et affichage
- Références
 - Autres solutions plus simples

Problématique

- Lorsqu'on se connecte plusieurs fois sur une même machine par `ssh`, l'historique conservé dans le fichier `~/.bash_history` est le dernier à se déconnecter de la machine en question. Cela signifie que l'on perd tout l'historique des autres sessions. C'est quelque chose de rageant, surtout si on avait fait une superbe commande complexe qui méritait d'être préservée, notamment pour compléter une documentation.
- On veut aussi savoir quand les commandes ont été tapées et surtout par qui lorsqu'on est plusieurs à partager un même compte d'administration comme le compte `root`, le tout avec `sudo`.

Solutions

En cherchant un peu sur le net, nous trouvons cette page qui semble être l'une des plus avancée dans cette gestion de l'historique avec `bash` :

- <http://nods.com/blog/leeland/2012/03/07-all-bash-history-revisited-load-time-solved-plus-directory-history>

Son intérêt, c'est de penser à la conservation du contexte d'exécution des commandes en enregistrant le répertoire de travail de la commande historisée.

Évolutions apportées

L'objectif de cette historisation des commandes en `bash` a pour vocation de savoir qui fait quoi en tant qu'utilisateur administrateur (`root`) sur chaque machine administrée. En effet, lorsqu'on est plusieurs à administrer une machine, donc à utiliser le compte `root`, on ne s'embarrasse pas de taper toutes les commandes en les commençant par un `sudo` redondant mais on a plutôt tendance à exécuter un shell `bash` interactif — genre `sudo -i` ou `-s`.

Dans la solution précédente, il manque l'information de l'utilisateur ayant fait le `sudo` pour devenir `root` ainsi que la concaténation de tous les historiques des différentes personnes dans un historique commun propre à `root`. Enfin, on souhaite pouvoir aussi se connecter directement en `root` et continuer à bénéficier de l'historique alimenté par tous les administrateurs.

Explications

Les scripts suivants introduisent plusieurs fonctions utilisées pour donner un fichier d'historique contenant toutes les informations voulues. Ces scripts (`~/bin/acd_func.sh` et `~/bin/a_loghistory_func.sh`) sont le cœur de l'application.

- `_loghistory` — fonction qui gère l'historique en ajoutant toutes les informations souhaitées (`tty`, `user`, `sudo_user`, date de la commande, répertoire de la commande).
- La variable `PROMPT_COMMAND` décrit ce qu'il faut exécuter à l'affichage de chaque nouveau `prompt`. On fait donc en sorte d'utiliser `_loghistory`.
- `cd_func` — fonction de gestion des changements de répertoire. Permet l'ajout des répertoires successifs dans une pile des 10 plus récents répertoires utilisés et qui va permettre de l'utiliser pour revenir à ces anciens répertoires (utilise les commandes interne à `bash` `pushd`, `popd` et `dirs`. La pile de répertoires est limitée à 10 emplacements.
 - Exemple : si `dirs` renvoie `~ /etc /tmp`, utiliser `cd -2` nous ramènera au répertoire `/tmp`.
- À la connexion, l'ensemble des 20 derniers répertoires utilisés sera chargé dans la pile des répertoires de travail de `dirs` et `cd_func`. Il sera donc possible, après déconnexion, de revenir à un répertoire de travail qu'on aurait perdu sinon.

En plus du cœur de l'application, il y a aussi quelques scripts organisant un peu plus finement le `~/.bashrc`. Celui-ci fait appel à des fichiers se trouvant dans le répertoire `~/bashrc.d/` et contenant les adaptations personnelles comme les *variables shell*, les *fonctions* propres à notre utilisation ainsi que la partie initialisation des scripts de gestion de l'historique. Ces derniers se trouvent dans `~/bin/`.

Enfin, il y a quelques fonctions utilitaires supplémentaires :

- `hh` — l'historique complet avec toutes les informations.
- `h` — alias vers `history`
- `cd` — alias vers la fonction `cd_func`
- `hd` — liste l'ensemble des derniers répertoires de travail.

Cette solution modifie le comportement de :

- `cd` qui devient un alias sur la fonction `cd_func` décrite ci-dessous ;
- l'historique (utilisation de la fonction `_loghistory`)

Ajoute les fonctions d'historique suivantes :

- `h` comme alias vers `history` resté inchangé ;
- `hh`, fonction d'historique complet avec toutes les infos (répertoire de travail, utilisateur faisant la commande, date de la commande, fin des sessions, tty utilisé) ;
- `hd`, fonction d'historique des répertoires de travail.

Cette solution crée les fichiers suivants :

- `~/.history_log.<nom fqdn machine>.<login utilisateur>` — le fichier d'historique complet avec toutes les informations
- `~/.history-<nom fqdn machine>.<login utilisateur>` — le fichier d'historique normal (mais avec un nom différent).
- `/root/.history-<nom fqdn machine>.root` — le fichier d'historique complet de `root` si on fait du `sudo root`.

Les scripts

Voici les quelques scripts nécessaires au bon fonctionnement de cet historique commun pour `root` et correctement mis en place pour un usage par utilisateur privé.

`~/.bashrc`

```
#!/bin/bash

# Check if the file exists
if [ -f "$HOME/.bashrc" ]; then
    . "$HOME/.bashrc"
fi

# Check for an interactive session
if [ -z "$PS1" ]; then
    return
fi

#####
##### charger tous les fichiers #####
##### source ~./bashrc.d/general 
```

`~/.bashrc.d/general` — le fichier qui charge les autres fichiers d'initialisation des paramètres du bash (en interactif)

~/.bashrc.d/general

```
##### Options de bash #####
# pour ne pas écraser mais ajouter les nouvelles lignes de bash à l'historique
# options normalement par défaut - donc normalement inutile
shopt -s histappend cmdhist
# pour ne pas avoir à faire cd avant de changer de répertoire : (à expérimenter)
#shopt -s autocd

##### Variables locales #####
[ -r ~/.bashrc.d/variables ] && source ~/.bashrc.d/variables

##### Historique #####
# solution d'ici :
# http://nodsw.com/blog/leeland/2012/03/07-all-bash-history-revisited-load-time-solved-plus-directory-history
[ -r ~/.bashrc.d/history ] && source ~/.bashrc.d/history

##### Alias #####
[ -r ~/.bashrc.d/aliases ] && source ~/.bashrc.d/aliases

##### Fonctions #####
[ -r ~/.bashrc.d/functions ] && source ~/.bashrc.d/functions
```

~/.bashrc.d/aliases — initialisation de bash : les alias personnels

~/.bashrc.d/aliases

```
# les alias de bash

# quelques idées ici : http://tldp.org/LDP/abs/html/sample-bashrc.html
